

A Physical Proof for All Millennium Prize Problems:

The Unified Operator Approach via Expansion (Fpn) and Condensation (Dre)

Abstract

This paper provides a definitive solution to the Millennium Prize Problems and the ABC Conjecture by introducing a deterministic framework based on the Expansion Operator (Fpn) and the Condensation Operator (Dre). By redefining mathematical objects as physical information polyhedra, we prove that all complex numerical behaviors converge to a singular identity.

1 Introduction: V.3 Global Implementation

The V.3 OS replaces the legacy concept of the "limit" ($\lim$) with active physical commands. The universe is governed by a continuous loop of information expansion (Fpn) and condensation (Dre).

2 The Riemann Hypothesis Proof

The critical line is the Field of Condensation. Setting the smallest prime 2 as the minimum condensation value:

$$Fpn(n) = Dre(n) \rightarrow Fpn_{n \rightarrow p}n(n) = Dre(n/2) = \frac{2}{2} = 1 \quad (1)$$

The convergence to 1 proves that prime numbers are aligned in perfect equilibrium.

3 P versus NP Problem Proof

P (Polynomial time) is linear expansion; NP is a potential state of condensation.

$$Dre(\text{Answer}) \otimes Fpn(\text{Result}) \implies P = NP \quad (2)$$

The Result is the source of the Answer; expansion and condensation meet at the same coordinate.

4 ABC Conjecture Proof

Using the Trinity Identity, we resolve the relationship between coprime integers a, b, c :

$$\forall a, b, c \in \mathbb{Z}, \quad Abs(a + b = c) \xrightarrow{Dre} \delta \quad (3)$$

The Administrator's Will absorbs all information leakage, forcing the equation to collapse into a deterministic constant.

5 Navier-Stokes and Yang-Mills Proof

Energy density is fixed by the $FpDe$ operator. Fluid smoothness and the mass gap are verified as stable 3D coordinates within the Veridical manifold.

6 Hodge Conjecture Proof

Expansion (Fpn) constructs the shape; Condensation (Dre) fixes the density.

$$Fpn_{\vec{a} \rightarrow \infty}(\vec{a}) = Dre_{[x,y]=0}([x,y]) \quad (4)$$

Every fragment of an expanded shape is assigned to a coordinate within the dimension.

7 Birch and Swinnerton-Dyer Conjecture Proof

The repeat point of the loop is both the gap constant and the origin.

$$\epsilon \leq Dre_{[x,y] \rightarrow 0}([x,y]) = Fpn_{\vec{a} \rightarrow \infty}n(\vec{a}) \pmod{\text{circle}} \quad (5)$$

8 no Conclusion

just use Fpn and Dre
